

PROBLEM SPACE

SOCIAL ROBOT CO-DESIGN CANVASES

What problem are you solving?

USER

Group(s) Who are the users? Are there supporting users? For example: students and teachers.	Characteristics What are the users like?	Needs What do the users need?
ED Triage Nurses primary users	Trained Clinical staff, 12-hour shifts, managing vitals + queue + patient questions simultaneously	Continuous Vitals Monitoring that flags deterioration without needing to be at bedside
secondary users Shift-lean nurses, Dr. De Freitas	Reviewing override logs & outcomes after the fact, not present at the point of care	Confidence that the tool is safe, audible & not silently overriding clinical judgement.
Goal(s) What do the primary and secondary users want to accomplish?		
Get an accurate, fast triage category during a sub-3-minute assessment window primary users	Reduce inconsistent triage decisions without adding cognitive load/eroding clinical judgement.	
secondary users Sees that overrides are logged and explainable	Evidence base to justify wider rollout across Mercer	
SHORT-TERM		LONG-TERM

ROBOT / TABLET

Task(s) What task does the robot perform?			
Display a triage classification (score + colour coded badge + contrib. features) for the active patient, & let the nurse confirm with 1 tap SHORT-TERM		Build a reliable audit trail of override decisions that can inform whether the model needs recalibration, and support a wider Mercer rollout case. LONG-TERM	
Advantages What advantages does using a robot bring (compared to a computer or human)?			
N/A Social skills	N/A User's emotional response	N/A Personalization	consistent, repeatable classification/ogic applied the same way 24/7; despite nurse fatigue Precise tasks
N/A Data collection with sensors	Portable Mobility	N/A Environment manipulation	direct EHR pull, which a paper-based or purely human can't do Connection to systems
